

# Floating Point Representation – Chap 3

Prepared By Fairoz Nower Khan

# Floating Point

- Representation for non-integral numbers
  - Including very small and very large numbers
- Like scientific notation
  - $-2.34 \times 10^{56}$
  - $+0.002 \times 10^{-4}$
  - $+987.02 \times 10^9$
- In binary
  - $\pm 1.xxxxxxx_2 \times 2^{yyyy}$
- Types **float** and **double** in C

# Floating Point Standard

- Defined by IEEE Std 754-1985
- Developed in response to divergence of representations
  - Portability issues for scientific code
- Now almost universally adopted
- Two representations
  - Single precision (32-bit)
  - Double precision (64-bit)

# Normalized Number

- Only One and Non-Zero number before .(decimal point)

$$5.64 \times 10^{33} \rightarrow \text{Normalized}$$

$$109.64 \times 10^{33} \rightarrow 1.0964 \times 10^{33+2}$$
$$1.0964 \times 10^{35}$$

The number of times we left shift the (.),  
will be added with the exponent

$$0.675 \rightarrow 6.75 \times 10^{-1}$$

The number of times we right shift the (.),  
will be subtracted from the exponent

- Only One and Non-Zero number before .(binary point)

$$1011.1101 \times 2^{33} \rightarrow 1.011101 \times 2^{33+3} = 1.011101 \times 2^{36}$$

In Binary the Base is 2

$$0.0111101 \times 2^{-5} \rightarrow 1.11101 \times 2^{-5-2} = 1.11101 \times 2^{-7}$$

# Decimal to Floating Point Conversion

- Step 1: Convert the Decimal Number into Binary Number
- Step 2: Normalize the Binary Number
- Step 3: Find out the Biased Exponent
- Step 4: Find out Sign bit and Fraction
- Step 5: Write the Sign bit, Biased Exponent and Fraction in IEEE-754 Floating Point Representation

# IEEE Floating-Point Format

single: 8 bits  
double: 11 bits

single: 23 bits  
double: 52 bits

S	Exponent	Fraction
---	----------	----------

$$x = (-1)^S \times (1 + \text{Fraction}) \times 2^{(\text{Exponent} - \text{Bias})}$$

- S: sign bit (0  $\Rightarrow$  non-negative, 1  $\Rightarrow$  negative)
- Normalize significand:  $1.0 \leq |\text{significand}| < 2.0$ 
  - Always has a leading pre-binary-point 1 bit, so no need to represent it explicitly (hidden bit)
  - Significand is Fraction with the “1.” restored
- Exponent: excess representation: actual exponent + Bias
  - Ensures exponent is unsigned
  - Single: Bias = 127; Double: Bias = 1023

# Single Precision (32 bit)

(Biased)		
Sign bit	Exponent	Fraction/ Mantissa
1 bit	8 bit	23 bit

If  $n$  = bit length of Exponent Field,  
 $\text{Bias} = 2^{(n-1)} - 1$

**Sign Bit:** (0  $\Rightarrow$  Positive, 1  $\Rightarrow$  Negative)

**Exponent:**

8 bit unsigned binary Range = 0 to  $2^8 - 1 = 0$  to 255

Exponents 00000000 and 11111111 reserved, So the Range for Biased Exponent Becomes = **1 - 254**

**For Exponent being 8 bit, Bias =  $2^{(8-1)} - 1 = 127$**

For Single Precision

Biased Exponent = Actual Exponent of the Binary number + Bias (127)

Range for Exponent =  $2^{-126} - 2^{127}$

$$1.11101 \times 2^{35}$$

$$\begin{aligned}\text{Biased Exponent} &= 35 + 127 \\ &= 162 = 10100010\end{aligned}$$

$$1.11101 \times 2^{-8}$$

$$\begin{aligned}\text{Biased Exponent} &= -8 + 127 \\ &= 119 \\ &= 01110111\end{aligned}$$

# Example

- Convert 50.6749 to 32 bit IEEE-754 Floating Point Representation

- Step -1 Convert the Decimal Number To Binary Number

50.67490

Binary of 50 = 110010

Binary of .6749 = 1010110011

Binary of 50.6749 = 110010.1010110011

Binary of .6749

= .6749 x 2 = 1.3498 = 1

= .3498 x 2 = 0.6996 = 0

= .6996 x 2 = 1.3992 = 1

= .3992 x 2 = 0.7984 = 0

= .7984 x 2 = 1.5968 = 1

= .5968 x 2 = 1.1936 = 1

. = 0

. = 0

. = 1

. = 1

- Step -2 Normalize the Binary Number

Binary of 50.6749 = 110010.1010110011 x 2<sup>0</sup>

Normalized Binary Number =

1.100101010110011 x 2<sup>5</sup>

Fraction

- **Convert 50.6749 to 32 bit IEEE-754 Floating Point Representation**

Normalized Binary Number =  $1.100101010110011 \times 2^5$

- **Step -3 Find Out The Biased Exponent**

Exponent = 5

Biased Exponent =  $5 + 127$

= 132

= 10000100

- **Step -3 Find Out Sign Bit and Fraction**

Sign Bit = 0

Fraction = 100101010110011 00000000

**IEEE-754 Floating Point Representation of 50.6749**

01000010010010101011001100000000

= 0100 0010 0100 1010 1011 0011 0000 0000

= **0x424AB300**

- **Step -4 IEEE-754 Floating Point Representation**

(Biased)

Sign bit	Exponent	Fraction/ Mantissa
1 bit	8 bit	23 bit
0	10000100	100101010110011000000000

# Double Precision (64 bit)

(Biased)		
Sign bit	Exponent	Fraction/ Mantissa
1 bit	11 bit	52 bit

If  $n$  = bit length of Exponent Field,  
Bias =  $2^{(n-1)} - 1$

**Sign Bit:** (0  $\Rightarrow$  Positive, 1  $\Rightarrow$  Negative)

**Exponent:**

11 bit unsigned binary Range = 0 to  $2^{11} - 1$

Exponents 00000000 and 11111111 reserved, So the Range for Biased Exponent Becomes = **1 - 2046**

**For Exponent being 11 bit, Bias =  $2^{(11-1)} - 1 = 1023$**

For Double Precision

Biased Exponent = Actual Exponent of the Binary number + Bias (1023)

- Convert -0.232 to **12 bit IEEE-754 Floating Point Representation, Where Exponent is 4 bit**

Binary of 0.232 = 0.00111011

**Normalized Binary of 0.232 = 1.11011 x 2<sup>-3</sup>**

Exponent:

For Exponent being 4 bit, Bias =  $2^{(4-1)} - 1 = 7$

Exponent = -3

Biased Exponent =  $-3 + 7 = 4 = 0100$

If n = bit length of Exponent Field,  
Bias =  $2^{(n-1)} - 1$

Sign Bit and Fraction:

Sign Bit = 1

Fraction = 1101100

Floating Point Representation

1 0100 1101100

1010 0110 1100 = 0xA6C

- Convert  $1.232 \times 10^2$  to **15 bit IEEE-754 Floating Point Representation, Where Exponent is 5 bit**

Binary of  $1.232 \times 10^2 = 123.2 = 1111011.0011$

**Normalized Binary of 123.2 =  $1.1110110011 \times 2^6$**

Exponent:

For Exponent being 5 bit, Bias =  $2^{(5-1)} - 1 = 15$

Exponent = 6

Biased Exponent =  $6 + 15 = 21 = 10101$

If  $n$  = bit length of Exponent Field,  
Bias =  $2^{(n-1)} - 1$

Sign Bit and Fraction:

Sign Bit = 0

Fraction = 111011001

Floating Point Representation

0 10101 111011001

0 10101 1110110010 = 57B2

# Hexadecimal

- Base 16
  - Compact representation of bit strings
  - 4 bits per hex digit

0	0000	4	0100	8	1000	c	1100
1	0001	5	0101	9	1001	d	1101
2	0010	6	0110	a	1010	e	1110
3	0011	7	0111	b	1011	f	1111

- Example: eca8 6420
  - 1110 1100 1010 1000 0110 0100 0010 0000

# Floating Point (Single Precision) to Decimal

(Biased)

• 0xF2400240

Sign bit	Exponent	Fraction/ Mantissa
1 bit	8 bit	23 bit

**Step 1: Hexadecimal to Binary**

1111 0010 0100 0000 0000 0010 0100 0000

**Step 2: Set the Binary Number as Format**

1 11100100 100000000000001001000000

**Step 3: Find Out Exponent and Fraction**

Biased Exponent = 11100100

Biased Exponent (Decimal) = 228

**Exponent (Decimal) = 228 - 127**      For Exponent being 8 bit, Bias =  $2^{(8-1)} - 1 = 127$   
**= 101**

**Fraction/ Mantissa** = 0.100000000000001001000000

=  $2^{-1} + 2^{-15} + 2^{-18}$

= 0.5000343323

**Decimal Value =  $(-1)^{\text{SignBit}} \times (1 + \text{Fraction}) \times 2^{(\text{Exponent})}$**

$(-1)^1 \times (1 + 0.5000343323) \times 2^{101}$

= - 1.5000343223 x  $2^{101}$

**= - 3.803038843 x  $10^{30}$**

Upto 5 decimal point with Rounding = - 3.803034 x  $10^{30}$

Upto 5 decimal point without Rounding = - 3.803033 x  $10^{30}$

# Practice

Consider the value 63.7813

a) Let's assume you have a 21-bit register having 6-bit for exponent. Now convert this value using IEEE floating-point representation. Also, convert this into hexadecimal form.

Ans: 49FC8

b) Let's assume you have a 12-bit register having 4-bit for exponent. Now convert this value using IEEE floating-point representation. Also, convert this into hexadecimal form

Ans: 67F
